

Weifan Li

540-998-5718 | li.weifa@northeastern.edu | github.com/lhq5520 | Vancouver, BC (Open to relocate for co-op)

EDUCATION

Northeastern University

Master of Science in Computer Science; GPA: 3.9/4.0

Vancouver, BC

Jan. 2024 – May. 2026

Virginia Polytechnic Institute and State University

Bachelor of Science in Human Nutrition, Foods, and Exercise; GPA: 3.7/4.0

Blacksburg, VA

Aug. 2018 – Jan. 2022

EXPERIENCE

Backend Web Developer Intern

Qihoo 360

Oct. 2022 – Jan. 2023

Beijing, China

- Developed **Spring Boot** REST APIs for task and asset management, enabling users to create ETL workflows and discover **Hive/MySQL** data assets through standardized endpoints, by implementing CRUD controllers with **MyBatis** dynamic SQL, pagination, and parameter validation.
- Built integration components with **Azkaban** scheduler for automated task deployment and cron execution, supporting workflow submission and execution status tracking, by developing REST API clients to communicate with Azkaban's scheduling service under senior developer guidance.
- Contributed to asset management features enabling automated **Hive** table cataloging and **MySQL** metadata synchronization, by implementing APIs for metadata extraction, field validation, and asset registration workflows.

PROJECTS

Mountify — E-commerce Platform | *Next.js, TypeScript, Redis, PostgreSQL, Stripe*

2025

- Built a full-stack e-commerce platform with product catalog, cart/checkout flow, and admin dashboard using **Next.js**, **TypeScript**, **PostgreSQL**, and **Stripe**.
- Integrated **Stripe Checkout** with an event-driven webhook pipeline, reducing payment confirmation latency from 30+ seconds to 1–2 seconds and implementing idempotent charge handling with signature verification to prevent duplicate payments.
- Hardened backend security by enforcing server-side **price and inventory validation**, querying prices from PostgreSQL and implementing atomic inventory reservations with row-level locking to prevent overselling.
- Optimized read-heavy endpoints to sub-150ms response times (5x faster) by implementing **Redis caching** and adding strategic database indexes on foreign keys and frequently queried columns.

Personal Blog | *React, Vite, Node.js, Express, MongoDB*

2024

- Migrated a **Python Flask** blog to a modern **React + Node.js/Express** SPA, achieving **70%+ faster dev server startup** and eliminating full-page reloads by implementing React Router and migrating to **TypeScript** for type safety.
- Reduced invalid API request errors by **~40%** by implementing **Mongoose schema validation** and request-level input validation across all REST endpoints with proper access control.
- Improved article load performance by **~30%** on larger datasets by implementing **MongoDB pagination** with parallel queries using **Promise.all()**, and enhanced content editing by **~20%** through **CKEditor 5** integration.
- Built secure authentication with **JWT tokens** in **httpOnly** cookies and **Google OAuth 2.0** via Passport.js, implementing admin email whitelisting and session management.

TECHNICAL SKILLS

Languages & Backend: C, Java, Python, JavaScript, TypeScript, SQL, Spring Boot, Flask, Express.js, REST APIs, Microservices, React, HTML/CSS, JWT Authentication

Data & Infrastructure: PostgreSQL, MongoDB, MySQL, Redis, Kafka, Spark, Kubernetes, Docker Compose, Unix/Linux, Nginx, Git, CI/CD, JUnit
